

## Files

- **Object template file**

This ZW3D file becomes the default file for the object templates displayed by the **New File/Object Form** when a new ZW3D object is created (e.g. part, drawing sheet, etc.). The template file name is similar as "Templates\_IN.Z3". A default Templates file is located in the "resource" directory of your installation directory. Do not specify a path along with the template filename.

ZW3D searches for the specified template file in your user directory first, then in the ZW3D installation directories, then in the directories listed the **ZW3D Search Path Form**.

However, if you put a custom Templates\_IN.Z3 file in one of the directories listed in the **ZW3D Search Path Form**, it still will not be found by ZW3D if there is a default Templates\_IN.Z3 file in one of the installation directories. The solution is to move your custom Templates\_IN.Z3 file to your user directory or to give your template file a different name and log that name here.
